A METHOD FOR TREATING THE LARYNX DISEASES INVOLVING (54) PERSISTENT NON-JUNCTION OF VOCAL FOLDS.

(57) The invention relates to medicine, in particular - to otolaryngology. The invention is directed to prevent recurrencies. As a polymer, 3% polyacrylamide gel is introduced into a vocal fold submucously. An advantage of the proposed method consists in the absence of an inflammatory reaction in the injection area and of migration of the administered preparation, which circumstances allow to attain a steady

The invention relates to medicine, in particular - to otolaryngology.

The purpose of the invention consists in preventing recurrencies.

The method is carried out as follows.

3% polyacrylamide gel is introduced into a vocal fold submucously to replenish the lacking volumes.

Example. The patient: R-na O. A., age - 53 years. Diagnosis: Paralysis of the right half of larynx. 0.1 of 3% polyacrylamide

gel was introduced into the middle one-third of the right vocal fold submucously. Any inflammatory reaction during the postoperative period was essentially absent. The size of the fissure of glottis diminished. A husky voice of a medium sonority developed. An advantage of the proposed method consists in that the absence of an inflammatory reaction and of migration of the administered preparation allow to attain a steady functional effect and inhibit recurrencies.

CLAIMS

A method for treating the larynx diseases involving persis Lent nun-junction of vocal folds by injection of a polymer fold to replenish its lacking characterized in that, to inhibit recurencies: as a polymer, 3% polyacryiamide gel is introduced into a vocal fold submucousiy.
